3 IoT Safety Tips By VALLEY TECHLOGIC
"IoT" or Internet of Things Devices are Devices that have sensors, software, and other technologies that make them web capable.

1

Consider Having Them on a Separate Network

Creating a separate network specifically for your IoT devices will make it a little safer for the devices that actually contain your data (like your PCs and mobile devices).

2

Always Patch These Devices Too

It may be easy to set these devices up, connect them to Wi-Fi and then forget about them, but because they're internet enabled they may require security patches just like your regular devices do.

3

Consider Whether Something Really Needs Internet Access

Lots of devices are setup for Wi-Fi access but consider whether they really need to be connected to be a functional product for you or if connecting it to Wi-Fi doesn't add much functionality.
